

CITY OF SPEARFISH SAFETY GRAM

“Safety By Choice, Not By Chance!”

STAY SAFE OFF THE CLOCK!

PROTECT YOURSELF FROM UV RAYS!

We all enjoy a warm sunny day in the summertime. Spearfish sees an annual average of 227 days of sunshine every year. While this makes for a great and enjoyable place to live, this comes with some added risks to your health. Unlike a one-time accident like breaking your arm or hurting your back, the sun causes health hazards over longer periods of time. Due to this slower period, many people do not see the consequences of their actions until many years later. According to the CDC, anyone can get skin cancer, but people with certain characteristics are at greater risk—

- A lighter natural skin color.
- Skin that burns, freckles, reddens easily, or becomes painful in the sun.
- Blue or green eyes.
- Blond or red hair.
- Certain types and a large number of moles.
- A family history of skin cancer.
- A personal history of skin cancer.
- Older age.

Regardless of whether you have any of the risk factors listed above, reducing your exposure to ultraviolet (UV) rays can help keep your skin healthy and lower your chances of getting skin cancer in the future. Most people get at least some UV exposure from the sun when they spend time outdoors. Making sun protection an everyday habit will help you to enjoy the outdoors safely, avoid getting a sunburn, and lower your skin cancer risk. Here are some tips to reduce your sun exposure—

- Stay in the shade.
- Wear clothing that covers your arms and legs.
- Wear a hat with a wide brim to shade your face, head, ears, and neck.
- Wear sunglasses that wrap around and block both UVA and UVB rays.
- Use a broad spectrum sunscreen with a sun protection factor (SPF) of 15 or higher.

See below for more information from the CDC on protecting yourself, family and friends from skin cancer.

Skin Cancer

[Skin Cancer Home](#)

Sun Safety

Skin cancer is the most common cancer in the U.S. Too much sun can cause skin cancer. [This video](#) explains how to protect your skin from the sun.

Spending time outside is a great way to be physically active, reduce stress, and get [vitamin D](#). [↗](#) You can work and play outside without raising your skin cancer risk by protecting your skin from the sun.

Most skin cancers are caused by too much exposure to ultraviolet (UV) light. [UV rays](#) are an invisible kind of radiation that comes from the sun, tanning beds, and sunlamps. UV rays can damage skin cells.

Protection from UV rays is important all year, not just during the summer. UV rays can reach you on cloudy and cool days, and they reflect off of surfaces like water, cement, sand, and snow. In the continental United States, UV rays tend to be strongest from 10 a.m. to 4 p.m. daylight saving time (9 a.m. to 3 p.m. standard time).

The [UV Index](#) [↗](#) forecasts the strength of UV rays each day. If the UV index is 3 or higher in your area, protect your skin from too much exposure to the sun.

How to Protect Your Skin from the Sun

Shade

You can reduce your risk of sun damage and skin cancer by staying in the shade under an umbrella, tree, or other shelter. Your best bet to protect your skin is to use sunscreen or wear protective clothing when you're outside—even when you're in the shade.

Clothing

When possible, wear long-sleeved shirts and long pants and skirts, which can provide protection from UV rays. If wearing this type of clothing isn't practical, try to wear a T-shirt or a beach cover-up. Clothes made from tightly woven fabric offer the best protection. A wet T-shirt offers much less UV protection than a dry one, and darker colors may offer more protection than lighter colors. Some clothing is certified under international standards as offering UV protection.

Hat

For the most protection, wear a hat that has a brim all the way around that shades your face, ears, and the back of your neck. A tightly woven fabric, such as canvas, works best to protect your skin from UV rays. Avoid straw hats with holes that let sunlight through. A darker hat may offer more UV protection.

If you wear a baseball cap, you should also protect your ears and the back of your neck by wearing clothing that covers those areas, using sunscreen, or staying in the shade.

Sunglasses

Sunglasses protect your eyes from UV rays and reduce the risk of cataracts. They also protect the tender skin around your eyes from sun exposure.

Sunglasses that block both UVA and UVB rays offer the best protection. Most sunglasses sold in the United States, regardless of cost, meet this standard. Wrap-around sunglasses work best because they block UV rays from sneaking in from the side.

“Sunscreen isn’t an all-protective force field. It is intended to be combined with other sun-safety approaches.” Get [The Truth About Sunscreen](#) in this blog post.

Sunscreen

Put on broad spectrum [sunscreen](#) that filters out both UVA and UVB rays and has an SPF of 15 or higher before you go outside. Don’t forget to put a thick layer on all exposed skin. Get help for hard-to-reach places like your back. And remember, sunscreen works best when combined with other options.

Sunscreen is not recommended for babies who are 6 months old or younger. The [U.S. Food and Drug Administration](#) recommends keeping infants out of the sun during midday and using protective clothing if they have to be in the sun.

SPF. Sunscreens are assigned a *sun protection factor* (SPF), which is a number that rates how well they filter out UV rays. Higher numbers indicate more protection. You should use a broad spectrum sunscreen with SPF of 15 or higher.

Reapplication. Sunscreen wears off. Put it on again if you stay out in the sun for more than 2 hours and after swimming, sweating, or toweling off.

Expiration date. Check the sunscreen's expiration date. Sunscreen without an expiration date has a shelf life of no more than 3 years. Its shelf life is shorter if it has been exposed to high temperatures.

Sun Safety Tips for Schools

Recess and other outdoor activities during the day can put students at risk if their skin isn't protected from too much exposure to the sun. Teachers and school administrators can take steps to protect students from getting skin cancer later in life.

Increase Shade

- Provide shade structures or trees.
- Move outdoor activities to shaded areas.
- Plan for shade when developing or renovating school buildings, playgrounds, or athletic fields. [Shade Planning for America's Schools](#)  [PDF-975KB] can guide you.

Promote Sun-Safe Behaviors

- Encourage students to wear hats, sunglasses, and sunscreen outdoors.
- Try to avoid scheduling outdoor activities when the sun is strongest.
- Provide breaks during outdoor activities so that students can reapply sunscreen and get water.

Use Proven Educational Programs

Proven skin cancer prevention interventions and educational programs are available for child care centers and schools. The National Cancer Institute's [Evidence-Based Cancer Control Programs website](#)  lists sun-safety programs for schools.

Sun Safety Tips for Employers

The Occupational Safety and Health Act requires employers to minimize risk of harm to workers. Employers may be required to provide workers' compensation to employees who get skin cancer because of sun exposure on the job.

Skin cancer can greatly reduce workers' productivity. Every year, Americans lose more than \$100 million in productivity because of restricted activity or absence from work due to skin cancer.

Providing sun protection for outdoor workers helps create a healthy and safe workplace. It can also increase productivity, which saves money. Some of the tips below protect outdoor workers from [heat](#) as well as sun exposure.

Increase Sun Protection for Employees

- Encourage sun safety among your employees and provide sun protection when possible.
- Use tents, shelters, and cooling stations to provide shade at worksites.
- Schedule breaks in the shade and allow workers to reapply sunscreen throughout their shifts.
- Create work schedules that minimize sun exposure. For example, schedule outdoor tasks like mowing for early morning instead of noon, and rotate workers to reduce their UV exposure.

Add Sun Safety to Workplace Policies and Training

- Include sun-safety information in workplace wellness programs. The National Cancer Institute's [Evidence-Based Cancer Control Programs website](#)  lists sun safety programs for outdoor worksites.
- Teach outdoor workers about the [risks of exposure to UV rays](#) and the [symptoms of overexposure](#).
